

Java I/O Streams (Hinglish Notes)

1. Stream kya hota hai?

Stream data ka flow hota hai. Java me iska use input aur output handle karne ke liye hota hai.

2. Default Streams:

System.in -> input lene ke liye

System.out -> output print karne ke liye

System.err -> error print karne ke liye

3. Types of Streams (Direction):

Input Stream -> data read karta hai

Output Stream -> data write karta hai

4. Types of Streams (Data):

Byte Stream -> 8-bit data (image, video)

Character Stream -> 16-bit data (text)

5. Important Classes:

InputStream, OutputStream

FileInputStream, FileOutputStream

FileReader, FileWriter

BufferedReader

6. FileOutputStream Example:

Used to write data into file.

7. FileInputStream Example:

Used to read data from file.

8. FileWriter & FileReader:

Used for character data (text).

9. BufferedReader:

Fast reading, line by line data read karta hai.

10. Byte vs Character Stream:

Byte -> binary data

Character -> text data

Conclusion:

Java I/O Streams efficient data handling provide karte hain aur file handling me important role play karte hain.
